Figure e-1. Number of LTRA person-trials (a) and ICS person-trials (b) included in the cohort.
Figure e-2. The non-linear relationship between the predicted log hazards of management failure with BMI percentile at baseline for children not using their prescribed Step-2 therapy (treatment non-compliance) as well as those using low-dose ICS and LTRA monotherapies. The fit of the marginal model significantly improves with the 4-knot restricted cubic spline function for BMI percentile.
