relatively healthy population it is likely that some of the associations remained undetected; for instance, the prevalence of eating disorders was not high enough to examine DSP reliably.

**P061 CAN NON-PHARMACOLOGICAL INTERVENTIONS FOR NOCTURIA IMPROVE SLEEP OUTCOMES? A SYSTEMATIC REVIEW**

1Ilan Kellar*, 1Ashleigh Hyde, 1Amy Love, 1Charlotte Naylor, 1Amelia-Jayne Parkinson Naylor, 2Anna Weighall. 1School of Psychology, University of Leeds, Leeds, UK; 2School of Education, University of Sheffield, Sheffield, UK.

10.1136/bmjresp-2019-bssconf.61

**Background** Nocturia results in reduced sleep due to waking after sleep onset. Treatments for nocturia may result in improved sleep outcomes, but lack of evidence for long-term outcomes has brought pharmacological approaches to managing nocturia into question. Behavioural approaches for nocturia management have not been assessed for their effects on sleep.

**Objective** To evaluate the evidence for non-pharmacological nocturia treatments on sleep outcomes in adults.

Search methods: Four databases (Medline, PsychINFO, Embase & Web of Science) were searched, and relevant results were hand-searched for additional papers. Databases were last searched in November 2018. Selection criteria.

The population was adults; the interventions were non-pharmacological treatments for nocturia; outcomes were measures of sleep; study designs were restricted to randomised controlled trials. No limit was placed on comparison or year of publication. The publication type was restricted to journal articles in English.

**Results** Only 3 studies (N=137) were found to be relevant. No significant differences between intervention and control for nocturia outcomes was found in any study. There were mixed, but mostly null findings for objectively measured sleep outcomes. There was some evidence for subjective sleep outcomes.

**Conclusion** The small, underpowered studies that were found limit the conclusions that can be drawn from this evidence base. Given the low of sleep quality associated with nocturia is implicated in the development of hypertension and type 2 diabetes, larger, appropriately powered trials should be undertaken.

**P062 NON-PHARMACOLOGICAL INTERVENTIONS FOR SLEEP PROBLEMS IN NEURO-TYPICAL CHILDREN: A SYSTEMATIC REVIEW**

1Clarice Turton*, 1Anna Hamilton, 2Anna Weighall, 1Ian Kellar. 1School of Psychology, University of Leeds, Leeds, UK; 2School of Education, University of Sheffield, Sheffield, UK.

10.1136/bmjresp-2019-bssconf.62

**Context** Sleep disturbances and disorders are common in children. Non-pharmacological interventions for such disorders are recommended by current guidelines. Recent reviews important in this area focus solely on children with neurodevelopmental disorders (Scantlebury et al., 2018). The current review seeks to synthesise the evidence for children in the the non-clinical population.

**Objective** To expand upon recent reviews by reviewing non-pharmacological interventions for sleep problems in neuro-typical children.

**Data Sources** Five electronic databases (MEDLINE, EMBASE, PsycINFO, CINAHL and Cochrane databases) were searched using search terms including and relating to ‘Children’, ‘Sleep’, ‘Behavioural Interventions’ and ‘Randomised Control Trials’.

**Study selection** Randomised control trials using non-pharmacological interventions with a sleep outcome, for children and adolescents over five years old were included in the study.

**Synthesis. Results** were synthesised narratively in relation to intervention content, delivery and efficacy.

**Conclusions** The studies overall support the recommendation of using non-pharmacological interventions for sleep problems in children. The majority of research to date has investigated the efficacy of cognitive behavioural techniques and was found to be effective in a clinical setting. Future research should evaluate the feasibility and efficacy of these techniques applied on a wider scale and in home settings in order to reach more children.
elucidated. However, it is clear that future research and policy initiatives to encourage families to prioritise sleep in the family routine has the potential to improve not only cognitive and academic outcomes but also child health and wellbeing.

ASSOCIATION BETWEEN SELF-REPORTED SLEEP-DISORDERED BREATHING AND ESTIMATED CARDIOVASCULAR RISK

1Lyudmila Korostovtseva*, 1Oxana Rotar, 1Asiyat Alieva, 1Mikhail Bochkarev, 1Maria Boyarinova, 1Nadezhda Zvartau, 1Yuri Sviryaev, 1Aleksandra Konradi, 1Eugene Shlyakhto. 2Almazov National Medical Research Centre, St Petersburg, Russia; 1TMI University, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia

Background Sleep-disordered breathing (SDB) is associated with the increased cardiovascular (CV) morbidity, however, it is not considered in the standard risk stratification scales.

Purpose We evaluated the association between self-reported SDB (population-based sample) and two common risk stratification scales: SCORE and ASCVD.

Methods We selected 526 adults without known CV-disease (156 males, 30%; mean age 54±6.8 years) from the population-based sample (the epidemiological study ESSE-RF). All subjects were interviewed (lifestyle, medical history, complaints) using standard questionnaire. We assessed self-reported snore (‘Do you snore?’) and sleep apnea (‘Do you have sleep apneas?’). Affirmative response was considered diagnostic. The 10-year risk of fatal CV-events was assessed by the SCORE high-risk charts calculator and ASCVD risk estimator.

Results Overall, 288 (55%) subjects had snoring, while 27 (5%) reported sleep apneas. Based on the SCORE the participants were divided as following: low risk (<1%) was the most predominant category (35%); moderate risk (≥1% and <5%)-16%, and very high risk-5%. No association was found between self-reported sleep apneas and CV-risk (p>0.05). Similarly, intermediate-high ASCVD-risk is more frequent in subjects with self-reported snoring compared to non-snorers: 27.1% vs. 7.5%, respectively (Chi-square=44.5, p<0.001). No association was found between self-reported sleep apneas and CV-risk (p>0.05). Similarly, intermediate-high ASCVD-risk is more frequent in snorers vs. non-snorers (34.7% vs. 16.4%, respectively, Chi-square=22.5, p<0.001), with no association between self-reported sleep apneas and ASCVD-risk (p>0.05). Logistic regression analysis demonstrated an association between SCORE-risk and self-reported snoring (OR=3.21 95%CI 1.82–5.67, p<0.001); between self-reported snoring and ASCVD-risk (OR=2.24 95%CI 1.35–3.71, p=0.002).

Conclusion In Russian population-based sample self-reported snoring (unlike self-reported sleep apnea) is associated with the increased 10-year risk of CV-events independently of the risk stratification scale. The lack of association between CV-risk and sleep apnea might be related to the subjective assessment.

SLEEP-WAKE CYCLE AND MELATONIN LEVELS IN PATIENTS WITH DISORDERS OF CONSCIOUSNESS

1Ekaterina Kondratieva, 1Lyudmila Korostovtseva*, 1Ivan Ternyukh, 1Mikhail Bochkarev, 1Sergey Kondratiev, 1Maria Frolova, 1Tatiana Aleksieva, 1Yuri Sviryaev, 2Natalia Zybrina, 1Natalia Dryagina, 1Anatoli Kondratiev. 2Almazov National Medical Research Centre, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia; 3The Niki1rov Russian Center of Emergency and Radiation Medicine, St Petersburg, Russia

Background and aims Sleep is considered to play an important role in neuroplasticity and posttraumatic brain recovery. The assessment of sleep structure and sleep-wake cycle in subjects with disorders of consciousness (DOC) might be useful for predicting prognosis and treatment approach modification. In our study we assessed sleep structure and sleep-wake cycle by long-term (>24h) polysomnography (PSG), melatonin and stress hormones levels in DOC patients - unresponsive wakefulness syndrome (UWS) and minimally conscious state (MCS).

Methods We included 27 patients (22–57 years old). Median time duration after the brain injury constituted 11 (1–96) months. We applied Coma Recovery Scale (CRS-R) for behavioral assessment and diagnosed UWS in 7 subjects and MCS in 20 patients (traumatic brain injury was the underlying reason in 20 subjects, hypoxia – in 5, other causes were verified in 2 cases). The full in-hospital attended PSG (Medicom, Russia) was recorded during 24 hours. Blood sampling for melatonin were evaluated 5 times a day (8.00, 15.00, 21.00, 00.00, 3.00), urine samples for melatonin were taken twice (day and night).

Results All (100%) patients demonstrated irregular sleep-wake cycle and fragmented, abnormal sleep structure, while 85% patients had normal melatonin level (within the reference values). Deep sleep was absent in 25% cases. REM sleep episodes, despite decreased duration, were present in the majority of patients (87%). There was no significant correlation between melatonin level and PSG parameters.

Conclusion In our study, DOC patients had irregular sleep-wake cycle and sleep structure violations. However, sleep-wake changes do not seem to be associated with the disorders of melatonin metabolism.

The study is supported by the grant of the RFFR #19-29-01066

THE ASSOCIATION BETWEEN THE LEVELS OF BRAIN-DERIVED NEUROTROPHIC FACTOR AND STRUCTURAL AND FUNCTIONAL PARAMETERS OF THE BRAIN IN CHRONIC INSOMNIA VS HEALTHY SUBJECTS

1Lyudmila Korostovtseva*, 1Irina Filchenko, 1Mikhail Bochkarev, 1Elena Medvedeva, 1Eugeniya Kazakova, 1Elena Vasilenko, 1Yuri Sviryaev, 1Mikhail Zykov, 1Darya Rybkova, 1Almazov National Medical Research Centre, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia

Background Brain-derived neurotrophic factor (BDNF) plays a crucial role in the neuronal networking and reorganization. BDNF levels are changed in neurological and psychiatric diseases. We assessed BDNF levels in patients with chronic primary insomnia (PI) and their association with the brain metabolism.
