elucidated. However, it is clear that future research and policy initiatives to encourage families to prioritise sleep in the family routine has the potential to improve not only cognitive and academic outcomes but also child health and wellbeing.

### P064 ASSOCIATION BETWEEN SELF-REPORTED SLEEP-DISORDERED BREATHING AND ESTIMATED CARDIOVASCULAR RISK

1Lyudmila Korostovtseva*, 2Oxana Rotar, 1Asiyat Aliya, 1Mikhail Bochkarev, 1Maria Boyarinova, 1,2Nadezhda Zvartau, 1,2Yuri Sviryaev, 1,2Aleksandra Konradi, 1Eugene Shlyakhto. 2Akamoz National Medical Research Centre, St Petersburg, Russia; 1ITMO University, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia

Background Sleep-disordered breathing (SDB) is associated with the increased cardiovascular (CV) morbidity, however, it is not considered in the standard risk stratification scales.

Purpose We evaluated the association between self-reported SDB (population-based sample) and two common risk stratification scales: SCORE and ASCVD.

Methods We selected 526 adults without known CV-disease (156 males, 30%; mean age 54±6.8 years) from the population-based sample (the epidemiological study ESSE-RF). All subjects were interviewed (lifestyle, medical history, complaints) using standard questionnaire. We assessed self-reported snore (‘Do you snore?’) and sleep apnea (‘Do you have sleep apneas?’). Affirmative response was considered diagnostic. The 10-year risk of fatal CV-events was assessed by the SCORE high-risk charts calculator and ASCVD risk estimator.

Results Overall, 288 (55%) subjects had snoring, while 27 (5%) reported sleep apneas. Based on the SCORE the participants were divided as following: low risk (<1%) was the most predominant category (35%); moderate risk (1% and <5%)-44%, high risk (5–10%)-16%, and very high-risk-5%. Based on the ASCVD scale the subjects were divided as following: low risk (<5%) consisted 55.4%; borderline (6–7.4%)-16.3%, intermediate (7.5–19.9%)-23%, and high-5.3%. High-to-very-high SCORE-risk was more frequent in subjects with self-reported snoring compared to non-snorers: 27.1% vs. 7.5%, respectively (Chi-square=44.5, p<0.001). No association was found between self-reported sleep apneas and CV-risk (p>0.05). Similarly, intermediate-high ASCVD-risk is found more often in snorers vs. non-snorers (34.7% vs. 16.4%, respectively,Chi-square=22.5, p<0.001), with no association between self-reported sleep apneas and ASCVD-risk (p>0.05).

Logistic multiple regression demonstrated an association between SCORE-risk and self-reported snoring (OR=3.21 95%CI 1.82–5.67, p<0.001); between self-reported snoring and ASCVD-risk (OR=2.24 95%CI 1.35–3.71, p=0.002).

Conclusions In Russian population-based sample self-reported snoring (unlike self-reported sleep apnea) is associated with the increased 10-year risk of CV-events independently of the risk stratification scale. The lack of association between CV-risk and sleep apnea might be related to the subjective assessment.

### P065 SLEEP-WAKE CYCLE AND MELATONIN LEVELS IN PATIENTS WITH DISORDERS OF CONSCIOUSNESS

1Ekaterina Kondratieva, 1Lyudmila Korostovtseva*, 1Ivan Ternovskiy, 1Mikhail Bochkarev, 1Sergey Kondratiev, 1Maria Frolova, 1Tatiana Aleksieva, 1,2Yuri Sviryaev, 1,2Natalia Yibina, 1Natalia Dryagina, 1Anatoli Kondratiev. 1Akamoz National Medical Research Centre, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia; 3The Nikiforov Russian Center of Emergency and Radiation Medicine, St Petersburg, Russia

Background and aims Sleep is considered to play an important role in neuroplasticity and posttraumatic brain recovery. The assessment of sleep structure and sleep-wake cycle in subjects with disorders of consciousness (DOC) might be useful for predicting prognosis and treatment approach modification. In our study we assessed sleep structure and sleep-wake cycle by long-term (≥24h) polysomnography (PSG), melatonin and stress hormones levels in DOC patients - unresponsive wakefulness syndrome (UWS) and minimally conscious state (MCS).

Methods We included 27 patients (22–57 years old). Median time duration after the brain injury constituted 11 (1–96) months. We applied Coma Recovery Scale (CRS-R) for behavioral assessment and diagnosed UWS in 7 subjects and MCS in 20 patients (traumatic brain injury was the underlying reason in 20 subjects, hypoxia – in 5, other causes were verified in 2 cases). The full in-hospital attended PSG (Medicom, Russia) was recorded during 24 hours. Blood sampling for melatonin were evaluated 5 times a day (8.00, 15.00, 21.00, 00.00, 3.00), urine samples for melatonin were taken twice (day and night).

Results All (100%) patients demonstrated irregular sleep-wake cycle and fragmented, abnormal sleep structure, while 85% patients had normal melatonin level (within the reference values). Deep sleep was absent in 25% cases. REM sleep episodes, despite decreased duration, were present in the majority of patients (87%). There was no significant correlation between melatonin level and PSG parameters.

Conclusion In our study, DOC patients had irregular sleep-wake cycle and sleep structure violations. However, sleep-wake changes do not seem to be associated with the disorders of melatonin metabolism.

### P066 THE ASSOCIATION BETWEEN THE LEVELS OF BRAIN-DERIVED NEUROTROPHIC FACTOR AND STRUCTURAL AND FUNCTIONAL PARAMETERS OF THE BRAIN IN CHRONIC INSOMNIA VS HEALTHY SUBJECTS

1Lyudmila Korostovtseva*, 1rina Filchenko, 1Mikhail Bochkarev, 1Elena Medvedeva, 1Eugenia Kazakova, 1Elena Vasilieva, 1Yuri Sviryaev, 1Mikhail Zykov, 1Asiyat Alieva, 1Darya Ryzhkova. 1Almazov National Medical Research Centre, St Petersburg, Russia; 2Sechenov Institute of Evolutionary Physiology and Biochemistry of RAS, St Petersburg, Russia

Background Brain-derived neurotrophic factor (BDNF) plays a crucial role in the neuronal networking and reorganization. BDNF levels are changed in neurological and psychiatric diseases. We assessed BDNF levels in patients with chronic primary insomnia (PI) and their association with the brain metabolism.
