**Efficacy of recombinant thrombomodulin for poor prognostic cases of
acute exacerbation in idiopathic interstitial pneumonia: Secondary
analysis of the SETUP trial**

Table S2

Table S2. Steroid treatment at stable state according to underlying IIPs and rhTM treatment

| | Prednisolone at stable state, yes/no | | p-value |
|-------------|--------------------------------------|-------------|---------|
| | IPF | Non-IPF IIP | |
| Control arm | 10/12 | 7/17 | 0.361 |
| rhTM arm | 4/8 | 11/16 | 0.734 |
| Total cases | 14/20 | 18/33 | 0.373 |

Abbreviations: IIP, idiopathic interstitial pneumonia; rhTM, recombinant human soluble thrombomodulin; IPF, idiopathic pulmonary fibrosis.

All parameters are given as frequencies and. Frequency of prednisolone therapy at stable state was compared between IPF and non-IPF IIP in Control and rhTM arms, and total cases using the Fisher's exact test.
